

Highlights

Elsevier-style highlights: 3-5 bullet points, each under ~85 characters, summarizing the paper's core contributions for the reader/editor at a glance. Adjust wording once the final manuscript text is locked, so these stay exactly consistent with the Abstract's claims.

- A statistically confirmed T-FNO/U-Net trade-off does not replicate on independent conditions.
- Cross-condition replication testing is proposed as standard practice for operator benchmarks.
- A model-level fix corrects nonphysical phase outputs during autoregressive rollout.
- A predeclared decision gate correctly rejects a non-replicating single-seed observation.
- A spectral divergence penalty restores mass conservation and partially transfers across conditions.

Notes: count characters per line against the specific target journal's limit (commonly 85 characters including spaces per Elsevier's guidelines, though this varies — verify against the current Guide for Authors). Five bullets is typically the maximum; three is the typical minimum.
